

From: 18 February 2024 to 17 August 2024

Cases (Cumulative)

This page shows the trend for reported cases for Australia.

While this series is quite timely (updated daily), it can be volatile and prone to wild unexplained swings, which sometimes makes it difficult to interpret.

The last 6 months are shown.

From: 21 July 2024 to 17 August 2024

Cases (7-day avg)

This page shows the recent reported cases for Australia.

While this series is quite timely (updated daily), it can be volatile and prone to wild unexplained swings, which sometimes makes it difficult to interpret.

The raw cases are smoothed with a 7-day average.

The last 4 weeks are shown.

From: 21 July 2024 to 17 August 2024

/ Reff

● AUS

This page shows the trend for Reff (case momentum) based on reported cases for Australia.

While the source case series is quite timely (updated daily), it can be volatile and prone to wild unexplained swings, which sometimes makes it difficult to interpret.

The Reff is a comparison of the current 7-day average against the same figure 7 days ago. This will tend to smooth out the differences in data collection methods and criteria across the states/territories.

Reff at 1.0 indicates the outbreak is stable - neither accelerating nor slowing. Values above 1.0 indicate the outbreak is accelerating, below 1.0 indicates the outbreak is slowing.

The last 4 weeks are shown.

From: 18 February 2024 to 17 August 2024

Cases (Cumulative)

NSW

Victoria

Queensland

This page shows the trend for reported cases for NSW, Victoria and Queensland.

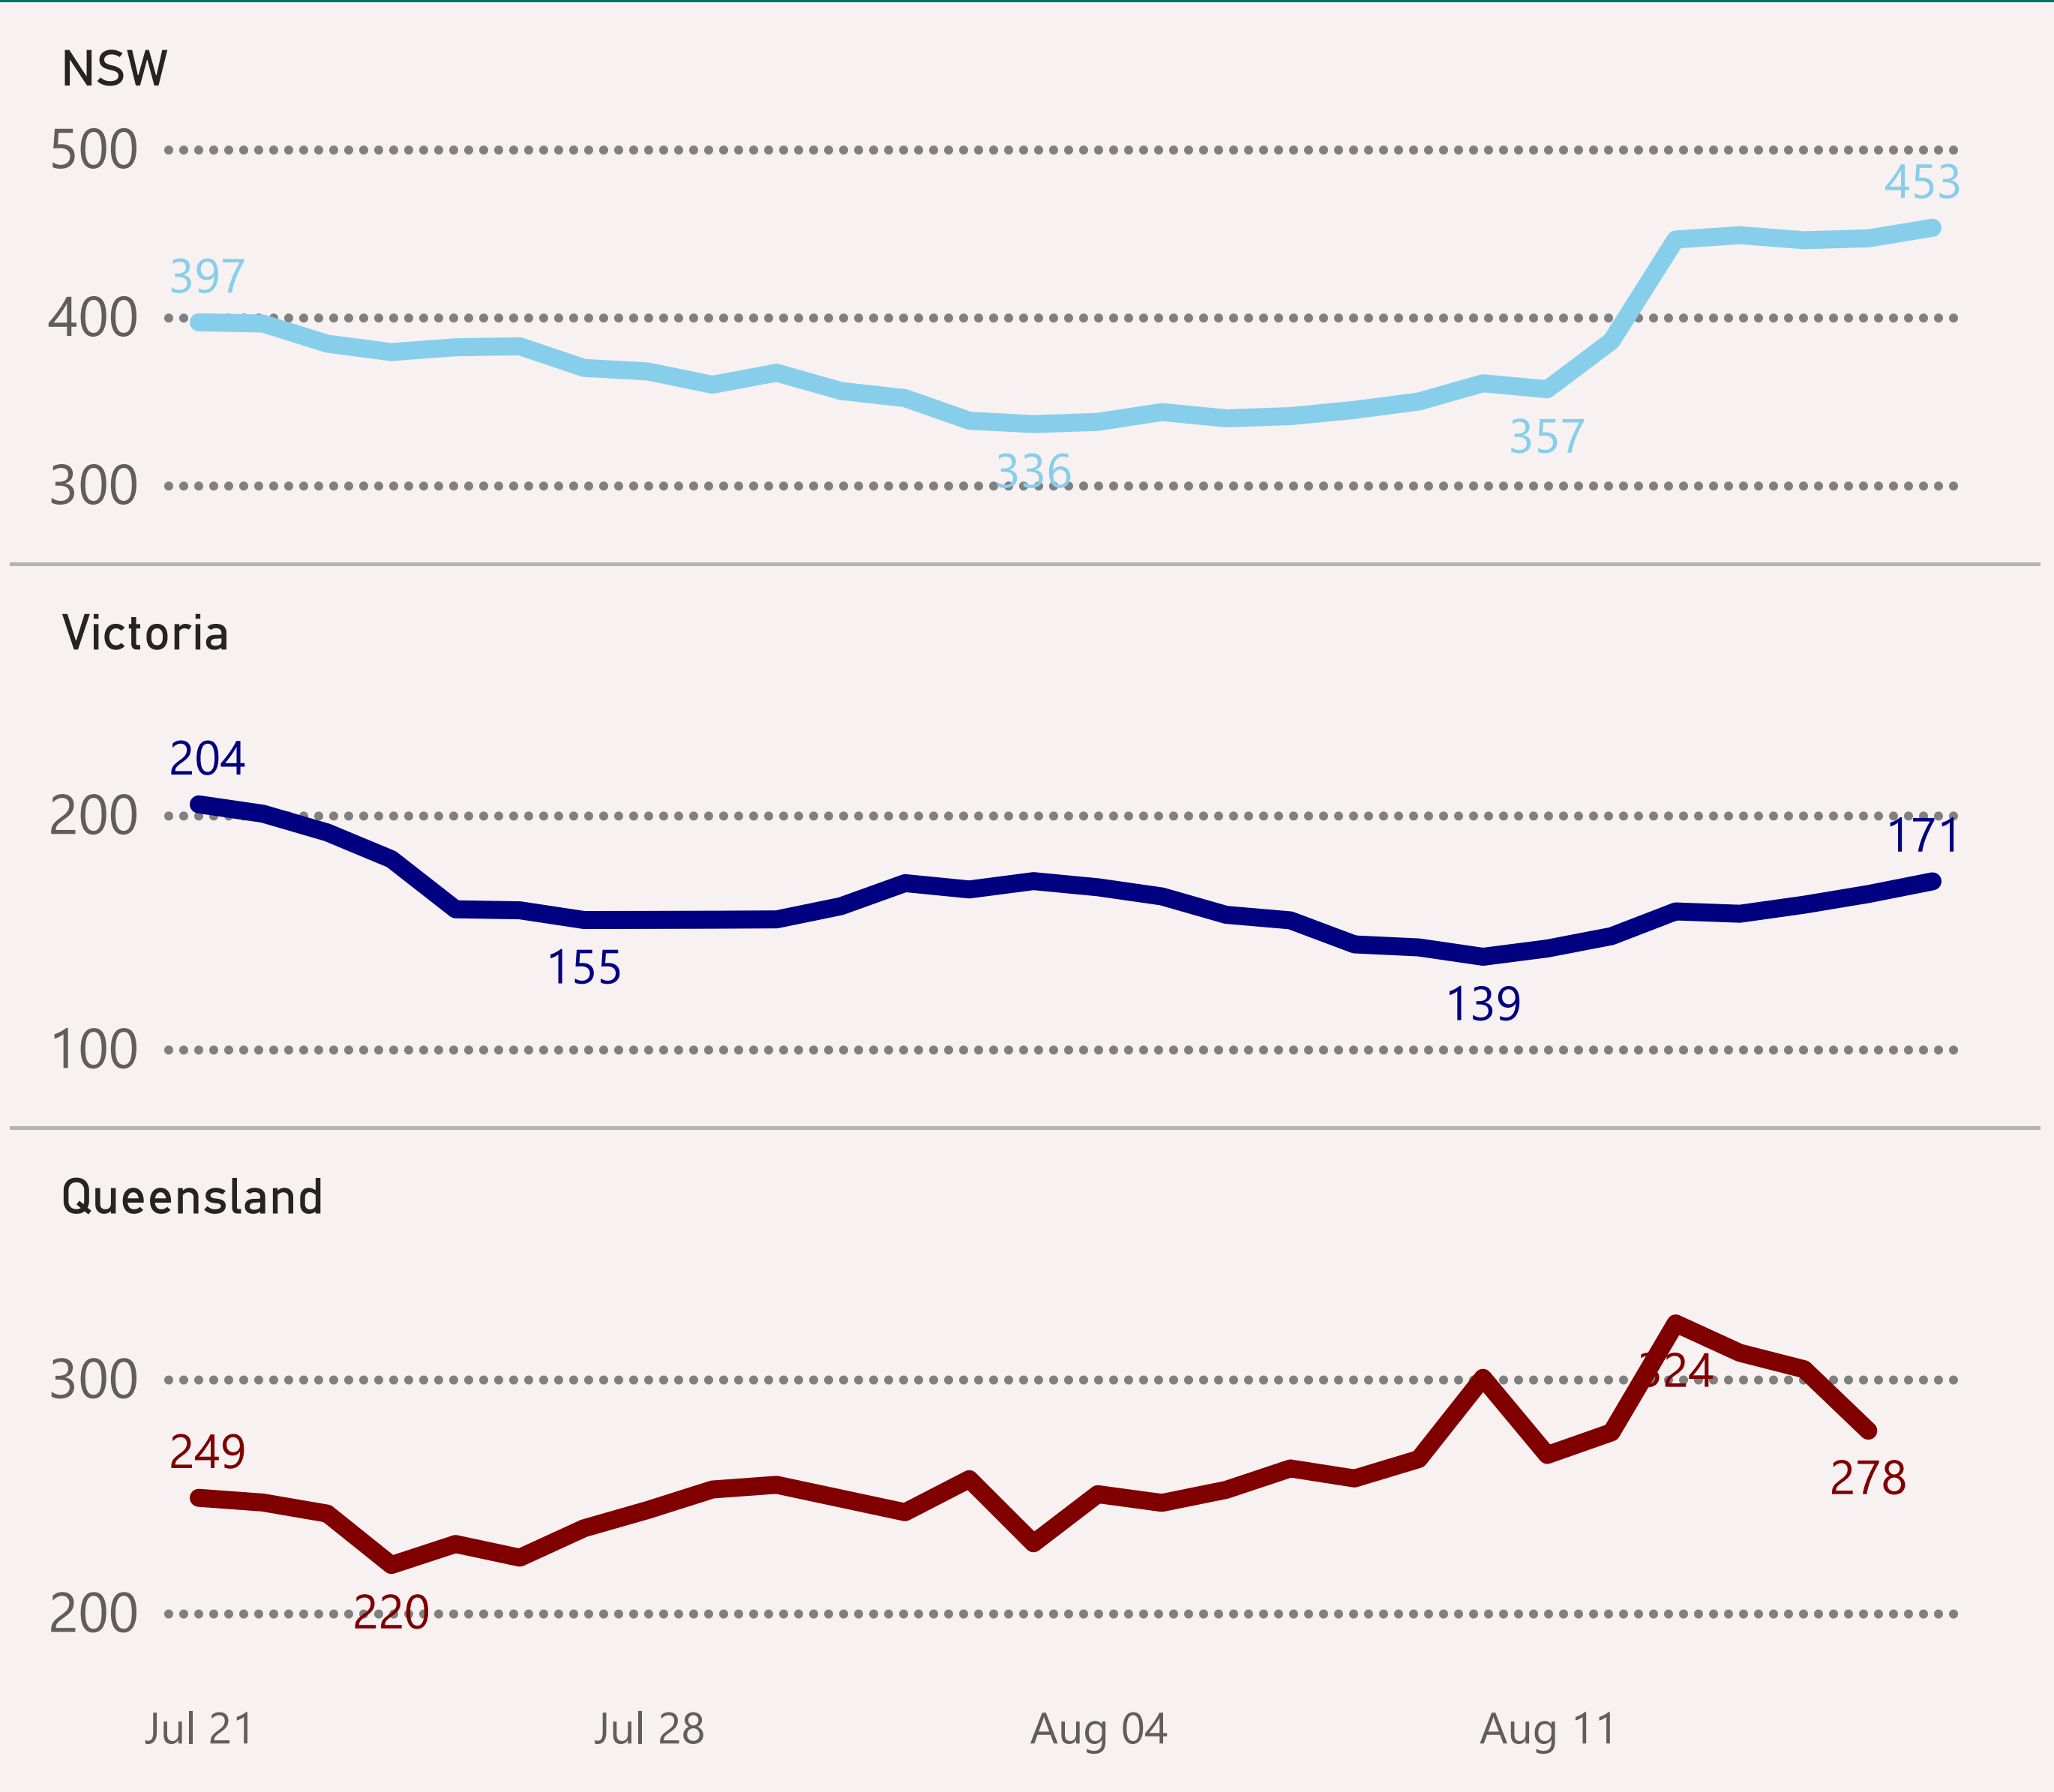

While this series is quite timely (updated daily), it can be volatile and prone to wild unexplained swings, which sometimes makes it difficult to interpret.

From my understanding, the data collection methods and criteria are fairly similar across these states, e.g. PCR cases only.

The last 6 months are shown.

From: 21 July 2024 to 17 August 2024

Cases (Cumulative)

SA

WA

Tasmania

This page shows the trend for reported cases for SA, WA and Tasmania.

While this series is quite timely (updated daily), it can be volatile and prone to wild unexplained swings, which sometimes makes it difficult to interpret.

From my understanding, the data collection methods and criteria are quite different across these states, e.g.

- SA: PCR cases
- WA: long lags with sporadic "massive dumps". Quite useless for analysis, but included for completeness
- TAS: was PCR+RAT but changed in April 2024 to PCR only, so can only compare trends.

The last 6 months are shown.

From: 21 July 2024 to 17 August 2024

Cases (7-day avg)
